

HTTP and Requests

Estimated time needed: 30 minutes

Objectives

After completing this lab you will be able to:

- Understand HTTP
- Handle HTTP Requests

Table of Contents

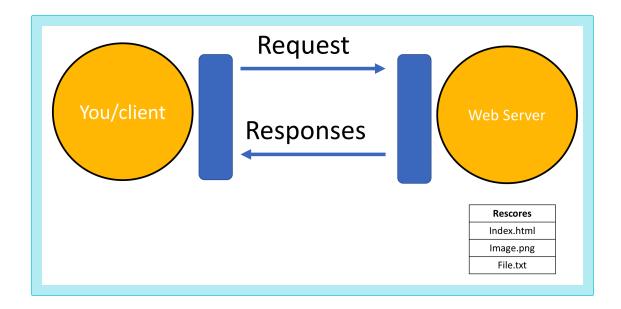

- Overview of HTTP
 - Uniform Resource Locator:URL
 - Request
 - Response
- Requests in Python
 - Get Request with URL Parameters
 - Post Requests

Overview of HTTP

When you, the **client**, use a web page your browser sends an **HTTP** request to the **server** where the page is hosted. The server tries to find the desired **resource** by default "index.html". If your request is successful, the server will send the object to the client in an HTTP response. This includes information like the type of the resource, the length of the **resource**, and other information.

The figure below represents the process. The circle on the left represents the client, the circle on the right represents the Web server. The table under the Web server represents a list of resources stored in the web server. In this case an HTML file, png image, and txt file.

The **HTTP** protocol allows you to send and receive information through the web including webpages, images, and other web resources. In this lab, we will provide an overview of the Requests library for interacting with the HTTP protocol.

Uniform Resource Locator: URL

Uniform resource locator (URL) is the most popular way to find resources on the web. We can break the URL into three parts.

- **Scheme**:- This is this protocol, for this lab it will always be http://
- Internet address or Base URL: This will be used to find the location here are some examples: www.ibm.com and www.gitlab.com
- **Route**:- Location on the web server for example: /images/IDSNlogo.png

You may also hear the term Uniform Resource Identifier (URI), URL are actually a subset of URIs. Another popular term is endpoint, this is the URL of an operation provided by a Web server.

Request

The process can be broken into the **Request** and **Response** process. The request using the get method is partially illustrated below. In the start line we have the GET method, this is an HTTP method. Also the location of the resource /index.html and the HTTP version. The Request header passes additional information with an HTTP request:

Request Start line	equest Start line Get/index.html HTTP/1.0					
Request Header User-Agent: python-requests/2.21.0 Accept-Encoding: gzip, deflate :						

When an HTTP request is made, an HTTP method is sent, this tells the server what action to perform. A list of several HTTP methods is shown below. We will go over more examples later.

HTTP METHODS	Description				
GET	Retrieves Data from the server				
POST	Submits data to server				
PUT	Updates data already on server				
DELETE	Deletes data from server				

Response

The figure below represents the response; the response start line contains the version number HTTP/1.0, a status code (200) meaning success, followed by a descriptive phrase (OK). The response header contains useful information. Finally, we have the response body containing the requested file, an HTML document. It should be noted that some requests have headers.

Response Message

Response Start line	HTTP/1.0 200 OK
Response Header	Server: Apache- Cache:UNCACHEABLE
Response Body	html <html> <body> <h1>My First Heading</h1> My first paragraph. </body> </html>

Some status code examples are shown in the table below, the prefix indicates the class. These are shown in yellow, with actual status codes shown in white. Check out the following link for more descriptions.

1XX	Informational
2xx	Success
200	ОК
ЗХХ	Redirection
300	Multiple Choices
4XX	Client Error
401	Unauthorized
403	Forbidden
404	Not Found

Requests in Python

Requests is a Python Library that allows you to send HTTP/1.1 requests easily. We can import the library as follows:

```
In [1]: import requests
```

We will also use the following libraries:

```
In [2]: import os
    from PIL import Image
    from IPython.display import IFrame
```

You can make a GET request via the method get to www.ibm.com:

```
In [3]: url='https://www.ibm.com/'
r=requests.get(url)
```

We have the response object r, this has information about the request, like the status of the request. We can view the status code using the attribute status_code.

```
In [4]: r.status_code
```

Out[4]: 200

You can view the request headers:

```
In [5]: print(r.request.headers)
```

{'User-Agent': 'python-requests/2.29.0', 'Accept-Encoding': 'gzip, deflate, br', 'A ccept': '*/*', 'Connection': 'keep-alive', 'Cookie': '_abck=B508211FF40114A6C7A7A85 9091C7EA2~-1~YAAQbe4uF31bdGCLAQAAIawSewrcnG8+V9sxNB012ceDwrASreWTFvkL5QxbRRhEjeyr89 xFCpBQ9VDdunA76BLE0fNNAKbkHao/1Vo3ZI1AavqCgZQ+leszrf8Yb3ck8jVOKhdsLaP+uFFPhT59Mn5QE 1DQ1uI+Nswftv7HrIzOsvAnhk6h44uGHvjlbaiv2W6v50YFk6STxM0T2TP2KF0GegJDVzX100FKt6+ys+GP YfjnR8kEN4uFYd2LN9Nvnl+FH2pRjvFAXiWLYJ5WEukCJoRxu8JzscJ4r+gHmNbti3GdAbNNYKVxBKQVSRb gvkjjDKlmbEaAWCSOT4If85QlWfwAhzG4j+f8WNSjVQaqN89Mpa0=~-1~-1~-1; bm_sz=A5CAC1189D948 90C3A537E5A5858495C~YAAQbe4uF35bdGCLAQAAIawSexWUkhFVGbqkHSqr0eieJHGFnjFx34PvZ1FC9Y7 fr0vUojvPAREru2fQhGIiaUptqoqzoGKduVEL3RPtWOmjSTCfe9m1/BQauVxHsRAsqfwqRNiS753oGow6s8 QFK/J8LmAum3xcw1HkPfDleUToSRWklDltSzgMmXhbI7CE5ayMBkldZa/7ab1kzF4oOAQsb230Eh6thuQCk 8h8FqiGrmfkZMrhykps0IH0Tl0HMlozvTbaf4C6MEG7c9DlaasL/yW8jy/Xsk+1X3mKb3g=~3750200~440 5556'}

You can view the request body, in the following line, as there is no body for a get request we get a None:

```
In [6]: print("request body:", r.request.body)
```

request body: None

You can view the HTTP response header using the attribute headers. This returns a python dictionary of HTTP response headers.

```
In [27]: header=r.headers
print(r.headers)
```

{'Date': 'Wed, 25 Oct 2023 20:09:14 GMT', 'X-Clv-Request-Id': '05b7f567-e1a7-4da0-9 2a5-14b1c8494c48', 'Server': 'Cleversafe', 'X-Clv-S3-Version': '2.5', 'Accept-Range s': 'bytes', 'x-amz-request-id': '05b7f567-e1a7-4da0-92a5-14b1c8494c48', 'ETag': '"8bb44578fff8fdcc3d2972be9ece0164"', 'Content-Type': 'image/png', 'Last-Modified': 'Wed, 16 Nov 2022 03:32:41 GMT', 'Content-Length': '78776'}

We can obtain the date the request was sent using the key Date .

```
In [29]: header['date']
```

Out[29]: 'Wed, 25 Oct 2023 20:09:14 GMT'

Content-Type indicates the type of data:

```
In [30]: header['Content-Type']
```

Out[30]: 'image/png'

You can also check the encoding:

```
In [31]: r.encoding
```

As the Content-Type is text/html we can use the attribute text to display the HTML in the body. We can review the first 100 characters:

```
In [32]: r.text[0:100]
```

You can load other types of data for non-text requests, like images. Consider the URL of the following image:

```
In [33]: # Use single quotation marks for defining string
url='https://cf-courses-data.s3.us.cloud-object-storage.appdomain.cloud/IBMDevelop
```

We can make a get request:

```
In [34]: r=requests.get(url)
```

We can look at the response header:

```
In [35]: print(r.headers)
```

{'Date': 'Wed, 25 Oct 2023 20:13:57 GMT', 'X-Clv-Request-Id': 'b2f4e45b-2360-4633-a 12d-224d5770ede3', 'Server': 'Cleversafe', 'X-Clv-S3-Version': '2.5', 'Accept-Range s': 'bytes', 'x-amz-request-id': 'b2f4e45b-2360-4633-a12d-224d5770ede3', 'ETag': '"8bb44578fff8fdcc3d2972be9ece0164"', 'Content-Type': 'image/png', 'Last-Modified': 'Wed, 16 Nov 2022 03:32:41 GMT', 'Content-Length': '78776'}

We can see the 'Content-Type'

```
In [36]: r.headers['Content-Type']
```

Out[36]: 'image/png'

An image is a response object that contains the image as a bytes-like object. As a result, we must save it using a file object. First, we specify the <u>file path and name</u>

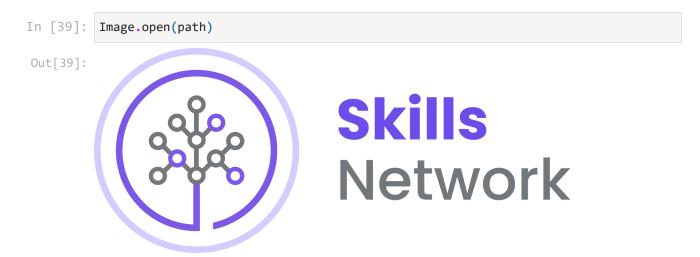

```
In [37]: path=os.path.join(os.getcwd(),'image.png')
path
```

Out[37]: '/resources/labs/authoride/IBMSkillsNetwork+PY0101EN/jupyterlite/files/Module 5/i mage.png'

We save the file, in order to access the body of the response we use the attribute content then save it using the open function and write method :

```
In [38]: with open(path,'wb') as f:
    f.write(r.content)
```

We can view the image:

Question 1: write wget

s=requests.get(url)

In the previous section, we used the wget function to retrieve content from the web server as shown below. Write the python code to perform the same task. The code should be the same as the one used to download the image, but the file name should be 'Example1.txt'.

```
!wget -0 /resources/data/Example1.txt https://cf-courses-
data.s3.us.cloud-object-
storage.appdomain.cloud/IBMDeveloperSkillsNetwork-PY0101EN-
SkillsNetwork/labs/Module%205/data/Example1.txt

In [6]: url= 'https://cf-courses-data.s3.us.cloud-object-storage.appdomain.cloud/IBMDevelopath=os.path.join(os.getcwd(),'example1.txt')
```

Get Request with URL Parameters

You can use the **GET** method to modify the results of your query, for example retrieving data from an API. We send a **GET** request to the server. Like before we have the **Base URL**, in the **Route** we append /get , this indicates we would like to preform a GET request. This is demonstrated in the following table:

Base URL	Route				
httbin.org	/get				
httbin.org/get					

The Base URL is for http://httpbin.org/ is a simple HTTP Request & Response Service. The URL in Python is given by:

```
In [9]: url_get='http://httpbin.org/get'
```

A query string is a part of a uniform resource locator (URL), this sends other information to the web server. The start of the query is a ?, followed by a series of parameter and value pairs, as shown in the table below. The first parameter name is name and the value is Joseph . The second parameter name is ID and the Value is 123 . Each pair, parameter, and value is separated by an equals sign, = . The series of pairs is separated by the ampersand & .

Start of Query	Parameter Name		Value		Parameter Name		Value
?	name	=	Joseph	&	ID	=	123
http://httpbin.org/get? Name=Joseph&ID=123							

To create a Query string, add a dictionary. The keys are the parameter names and the values are the value of the Query string.

```
In [10]: payload={"name":"Joseph","ID":"123"}
```

Then passing the dictionary payload to the params parameter of the get() function:

```
In [11]: r=requests.get(url_get,params=payload)
```

We can print out the URL and see the name and values.

```
In [12]: r.url
```

Out[12]: 'http://httpbin.org/get?name=Joseph&ID=123'

There is no request body.

```
In [45]: print("request body:", r.request.body)
        request body: None
          We can print out the status code.
 In [9]: print(r.status_code)
        200
          We can view the response as text:
In [10]: print(r.text)
          "args": {
            "ID": "123",
             "name": "Joseph"
          },
          "headers": {
             "Accept": "*/*",
             "Accept-Encoding": "gzip, deflate, br",
             "Host": "httpbin.org",
             "User-Agent": "python-requests/2.29.0",
             "X-Amzn-Trace-Id": "Root=1-64cc0a89-2ed1b4db08d6c26b271e6827"
          },
          "origin": "169.63.179.135",
          "url": "http://httpbin.org/get?name=Joseph&ID=123"
        }
          We can look at the 'Content-Type'.
In [11]: r.headers['Content-Type']
Out[11]: 'application/json'
          As the content 'Content-Type' is in the JSON format we can use the method
          json() , it returns a Python dict :
In [46]: r.json()
Out[46]: {'args': {'ID': '123', 'name': 'Joseph'},
           'headers': {'Accept': '*/*',
            'Accept-Encoding': 'gzip, deflate, br',
            'Host': 'httpbin.org',
            'User-Agent': 'python-requests/2.29.0',
            'X-Amzn-Trace-Id': 'Root=1-65397726-3046f0d40c7f970f7fcc9fe8'},
           'origin': '169.63.179.135',
           'url': 'http://httpbin.org/get?name=Joseph&ID=123'}
          The key args has the name and values:
In [47]: r.json()['args']
```

```
Out[47]: {'ID': '123', 'name': 'Joseph'}
```

Post Requests

Like a GET request, a POST is used to send data to a server, but the POST request sends the data in a request body. In order to send the Post Request in Python, in the URL we change the route to POST:

```
In [48]: url_post='http://httpbin.org/post'
```

This endpoint will expect data as a file or as a form. A form is convenient way to configure an HTTP request to send data to a server.

To make a POST request we use the post() function, the variable payload is passed to the parameter data :

```
In [49]: r_post=requests.post(url_post,data=payload)
```

Comparing the URL from the response object of the GET and POST request we see the POST request has no name or value pairs.

```
In [50]: print("POST request URL:",r_post.url )
    print("GET request URL:",r.url)
```

POST request URL: http://httpbin.org/post GET request URL: http://httpbin.org/get?name=Joseph&ID=123

We can compare the POST and GET request body, we see only the POST request has a body:

```
In [51]: print("POST request body:",r_post.request.body)
    print("GET request body:",r.request.body)
```

POST request body: name=Joseph&ID=123 GET request body: None

We can view the form as well:

```
In [52]: r_post.json()['form']
Out[52]: {'ID': '123', 'name': 'Joseph'}
```

There is a lot more you can do. Check out Requests for more.
